Figure 1 online. c-MEPs immediately after intubation and intense neuromuscular blockade. Tracing corresponding to left lower limb, anterior tibial muscle stimulation.
Figure 2 online. (A) Repetitive stimulation and c-MEP-TES rated by the neurophysiologist as useful for IOM. (B) Responses recorded are 4 out of 4 of the TOF, the first exceeding 1 mV. Also c-MEP-TES was recorded in the four muscle groups below the level of surgery with amplitude exceeding 100 microV (C).
Figure 3 online. c-MEP-TES high amplitude response several minutes after first sugammadex reversal.
Figure 4 online. Repetitive stimulation (left) and c-MEP-TES (right) after rocuronium 10 mg second reinjection. Absence of motor potentials can be seen.
Figure 5 online. Best recovery of c-MEP-TES 15 min after sugammadex reversal at the end of surgery.
Figure 6 online. Intact normal response in both left and right SSEPs.
