Table S1. The reasons for exclusion of 45 ineligible studies

	Reasons	Studies
	Irrelevant studies with ineligible comparisons (13 trials)	Harvey/2014[s1];Bauer/2000[s2];Huschak/2005[s3];Reynolds/1997[s4];Ibrahim/2005[s5];Chen/2006[s6];Nguyen/2007[s7];Montejo/2010[s8];Acosta-Escribano/2010[s9];Reignier/2013[s10];van Zanten/2014[s11];Montejo/2002[s12];Berg/2013[s13]
	More than 70% of daily caloric requirements in both groups (15 trials)	Desachy/2008[s14]; Huang/2012[s15]; Kagan/2015[s16]; Peake/2014[s17]; Schneider/2011[s18]; Heidegger/2013[s19]; Hsu/2009[s20]; White/2009[s21]; Singer/2011[s22]; Jakob/2017[s23]; Gonzalez-Granda/2018[s24]; Moreno/2014[s25]; Lu/2018[s26]; Caparrós/2011[s27]; Grau-Carmona/2011[s28]
	Less than 70% of daily caloric requirements in both groups (8 trials)	Montecalvo1992[s29]; MacLeod/2007[s30]; Qiu/2017[s31]; Charles/2014[s32]; Rugeles/2013[s33]; Taylor/1999[s34]; Montecalvo/1992[s35]; Kearns/2000[s36]
	No data on proportion of daily caloric intake to goal caloric requirements (2 trials)	Efremov/2017[s37]; Doig/2015[s38]
	Retrospective studies (3 trials)	Hartl/2018[s39]; Song/2016[s40]; Arabi/2010[s41]
	Abstractwithoutfull-text(2 trial)	Theodorakopoulou/2016[s42]; Norouzy/2013[s43]
	Ineligible patients (2 trials)	Wischmeyer/2017[s44]: This study enrolled critically ill adult patients in the ICU who received EN <60% estimated needs within 48 hours of ICU admission, then the eligible patients were randomized to receive either EN or PN + EN Ridley/2018[s45]: This study enrolled ICU patients who received <80% of
Document downloaded fro	n http://www.elsevier.es, day 03/07/2025. This copy is	estimated nutrition requirements from EN in the 24 hours prior to crandomization , then the eligible patients were randomized to receive either EN or PN + EN, moreover, patients in the PN + EN group had received PN as the main source of nutrition

Figure S2. Trial sequential analysis for the short-term mortality

Trial sequential analysis using random-effects model with an adjusted family-wise error rate of 3.3%, power of 80%, for a relative risk reduction of 15% in control event proportion. (panel A) In single-center trials, control event proportion of 25.0%, D² of 20% (the actual measured D2 was 0%). The cumulative Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 0.94 is 0.52 to 1.70. (panel B) In multi-center trials, control event proportion of 24.5%, D² of 13%, the cumulative Z-curve cross the futility area, but do not reach the required information size of 5278 participants. The TSA-adjusted 95% CI for an RR of 0.97 is 0.86 to 1.10. RR relative risk; TSA trial sequential analysis.

D

Trial sequential analysis using random-effects model with an adjusted family-wise error rate of 1.7%, power of 80%, for a relative risk reduction of 15% in control event proportion. (panel A) In all included trials, control event proportion of 12.3%, D2 of 20% (the actual measured D2 was 0%). The cumulative Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 0.96 is 0.41 to 2.23. (panel B) In trials received similar dose of protein, control event proportion of 17.7%, D² of 37%, the cumulative Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 0.96 is 0.26 to 3.56. (panel C) In multi-center trials, control event proportion of 13.1%, D2 of 20% (the actual measured D2 was 0%). The cumulative

Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 0.94 is 0.37 to 2.43. $_{\rm RR}$ relative risk; TSA trial sequential analysis.

Figure S12. Forest plot of meta-analysis for the incident of hypoglycemia

В

(panel A) Sub-analysis of trials with low or high risk of bias; (panel B) Sub-analysis of trials received similar or different dose of protein; (panel C) Sub-analysis of single-center or multi-center trials. RR relative risk.

Figure S13. Trial sequential analysis for the incident of hypoglycemia

Trial sequential analysis using random-effects model with an adjusted family-wise error rate of 1.7%, power of 80%, for a relative risk reduction of 15% in control event proportion. (panel A) In all included trials, control event proportion of 2.9%, D² of 20% (the actual measured D² was 0%). The cumulative Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 1.09 is 0.34 to 3.51. (panel B) In trials received similar dose of protein, control event proportion of 2.2%, D² of 20% (the actual measured D² was 0%), the cumulative Z-curve cross no boundaries. The TSA-adjusted 95% CI for an RR of 1.04 is 0.25 to 4.30. RR relative risk; TSA trial sequential analysis.

Figure S15. Trial sequential analysis for the incident of gastrointestinal intolerance

Trial sequential analysis using random-effects model with an adjusted family-wise error rate of 1.7%, power of 80%, for a relative risk reduction of 15% in control event proportion. (panel A) In all included trials, control event proportion of 23.8%, D² of 21%. The cumulative Z-curve cross the trial sequential monitoring boundary for benefit. The TSA-adjusted 95% CI for an RR of 0.78 is 0.67 to 0.90. (panel B) In trials received similar dose of protein, control event proportion of 20.2%, D² of 20% (the actual measured D² was 0%), the cumulative Z-curve cross the conventional boundary for benefit, but not the trial sequential monitoring

boundary for benefit. The TSA-adjusted 95% CI for an RR of 0.83 is 0.68 to 1.02. (panel C) In trials received different dose of protein (all were single-center trials), control event proportion of 40.4%, D² of 20% (the actual measured D² was 0%), the cumulative Z-curve cross the conventional boundary for benefit, but not the trial sequential monitoring boundary for benefit. The TSA-adjusted 95% CI for an RR of 0.61 is 0.15 to 2.51. (panel D) In multi-center trials, control event proportion of 22.8%, D² of 20% (the actual measured D² was 0%). The cumulative Z-curve cross the trial sequential monitoring boundary for benefit. The TSA-adjusted 95% CI for an RR of 0.61 is 0.15 to 2.51. (panel D) In multi-center trials, control event proportion of 22.8%, D² of 20% (the actual measured D² was 0%). The cumulative Z-curve cross the trial sequential monitoring boundary for benefit. The TSA-adjusted 95% CI for an RR of 0.80 is 0.69 to 0.93. RR relative risk; TSA trial sequential analysis.
